

## Nutrient Enhancement with Lower Columbia Fish Enhancement Group

Lower Columbia Fish Enhancement Group staff and volunteers work closely with WDFW to disperse salmon carcasses across four basins, East Fork Lewis, Kalama, Toutle, and Washougal. Fall Chinook nutrient enhancement began in late September, followed Coho into January.

Key nutrients supplied by anadromous salmonid carcasses play a crucial role in increasing the size and survival of salmonids, increasing productivity in riparian zones, and benefiting anadromous fish populations within each target watershed.
